🎓 EDUCATION

University College London — MSc Financial Mathematics London, UK | Sep 2025 – Sep 2026
Graduating: September 2026

University College London — BSc Mathematics London, UK | Sep 2022 – Jun 2025
Graduated: June 2025 | **Result:** First-class honours, final-year average 77.5%

Relevant modules (BSc & MSc):

Optimisation Methods	Risk Modelling	Asset Pricing
Interest Rate Modelling	Stochastic Analysis	Numerical SDE/PDE
Probability and Statistics	Machine Learning	Deep Learning

🏢 PROFESSIONAL EXPERIENCE

Harebare Garden Co., Ltd Gifu, Japan | Jun – Aug 2024
Data Analysis Intern

- Defined the analysis plan for the team's paid-search questions and built a keyword dataset from raw search logs
- Ranked keywords by expected return per unit of cost, joining search-frequency data with cost-per-click figures to identify high-interest, low-cost terms
- Regressed revenue on keyword-level spend in statsmodels and identified the spend level at which marginal return fell below marginal cost
- Distinguished search terms that converted from those that drove traffic only, and directed budget towards the former
- Cleaned and preprocessed the raw data in Python (NumPy), resolving inconsistencies in the source logs
- Built the Matplotlib reporting the team used to review keyword performance, seasonality and budget allocation

📊 RESEARCH & QUANTITATIVE PROJECTS

MSc Dissertation — Stochastic Volatility Models and Numerical Pricing Apr – Sep 2026

- Analysed the Black–Scholes and Heston models: modelling assumptions, risk-neutral pricing and the Heston pricing PDE
- Implemented finite-difference pricers in Python, including an ADI scheme for the Heston PDE, and benchmarked them on accuracy, stability and computational cost

Mathematical Modelling & Numerical Analysis Project (KdV Equation) May – Jun 2024

- Modelled weakly nonlinear wave behaviour with the Korteweg–de Vries equation, from physical assumptions to the dispersion relation, and ran numerical simulations to validate the results
- Led a small project group: set the modelling approach, divided the analytical and numerical work, chaired sessions to resolve competing methods, held the schedule, and consolidated the work into one technical report, which I presented

Pure Mathematics Project (Sums of Two and Four Squares) May – Jun 2023

- Worked through the proofs of Fermat's two-square and Lagrange's four-square theorems using elementary number theory, and represented the results geometrically
- Re-examined the problem from several angles when the initial approach failed, consolidated the group's differing solutions, and revised the steps that did not hold

Number Theory and Cryptography (Imperial College London) Jul 2021

- Worked in a small team and presented the group's findings on the number theory underlying RSA and symmetric/asymmetric encryption

✂ SKILLS & LANGUAGES

- **Programming:** Python; R; SQL; MATLAB; Mathematica; Excel VBA
- **Tools:** Vibe coding (Claude Code, Codex); Microsoft Office; Markdown; LaTeX
- **Languages:** English; Mandarin; Japanese
